

# Quick user guide

DripDrop Gravity Waterfiltration System and DripDrop Carbon Gravity Waterfilters

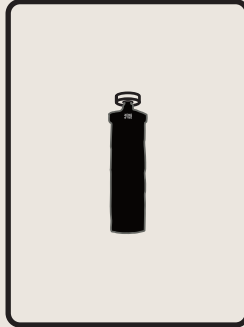

Follow these steps for a quick start

## Priming your DripDrop Carbon Gravity Waterfilters before using it.

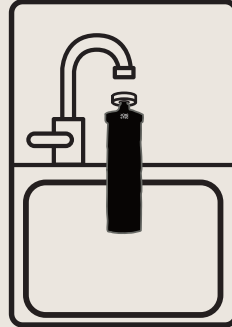

Follow these step to maximize flow and to remove loose particles.

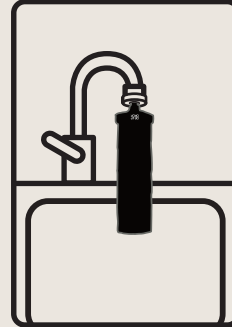

Prepare your priming ring and your DripDrop Filter, remove the wing nut from the filter.

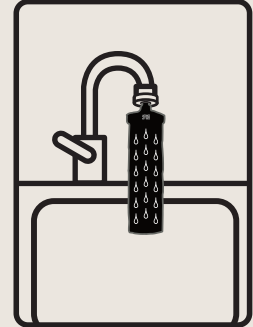

Put your priming ring on the end of your DripDrop Filter.

Place the DripDrop Filter with your priming ring on it under your faucet.

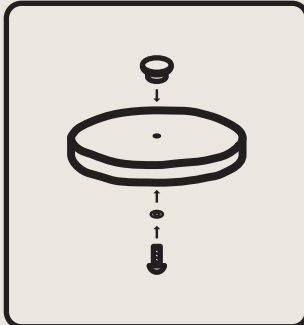

Press the ring between your tap and open the tap on a soft stream. Important: use only cold water.

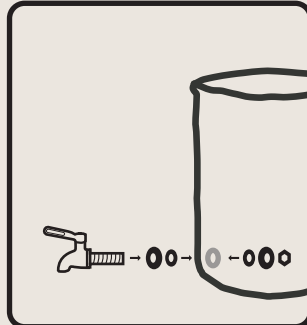

Run it under the tap so that the filter can be filled under pressure and when the water drops appear, hold it still for 1 to 2 minutes.

## Essembling your DripDrop Waterfiltration System.

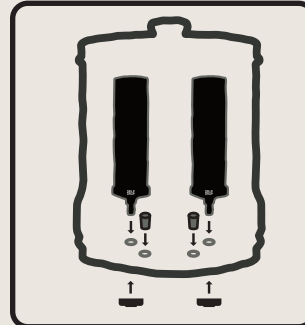

Slip the washer onto the screw and insert the top of the screw through the hole in the lid. Hand-tighten the knob onto the screw.

Remove the nut from the spigot. Remove the protective film from the spigot washers and place one spigot washer and one rubber washer on the spigot.

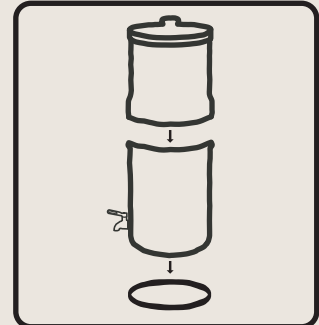

Insert the spigot through the hole in the lower water container and secure it with the other rubber washer, spigot washer and nut. Hold the nut in place and tighten by turning the spigot clockwise until it's in an upright position.

Hand-tighten the nut onto the spigot until it creates a seal (3-5 turns).

Place the filter stem through the hole in the upper container. Secure the filter using the wing nut below the upper container, do not over tighten.

Block the other holes with the rubbers if you are not using those filter holes.

Place the upper container with the installed filter securely on top of the lower container. Place the completed assembled DripDrop Waterfiltration System into the rubber base.
